D. G. Sarantites, L. G. Sobotka and A. C. Wahl

Last Revision: April 18, 2006
# Contents

1 Chemistry 435

1 Measurement and absorption of beta and gamma rays
   1.1 References .................................................. 16
   1.2 Introduction and Prelab Assignment .......................... 16
   1.3 Experimental Procedure ................................. 17
      1.3.1 Use and calibration of the dosimeter ............ 17
      1.3.2 Use of the radiation monitor .................. 17
      1.3.3 Absorption of γ-rays ............................... 18
      1.3.4 Plateau curve for the β counter ...................... 18
      1.3.5 Counting statistics ............................... 18
      1.3.6 Absorption of $^{234}\text{Pa}$ β− particles in aluminum .... 19
      1.3.7 Counter dead time ............................... 19
      1.3.8 Backscattering ........................................ 20
   1.4 Laboratory Report ....................................... 20
   1.5 Lecture No. 1 ........................................... 21

2 Preparation of samples for beta counting - Efficiency of the beta counter
   2.1 References .................................................. 28
   2.2 Introduction and Prelab assignment .................... 28
   2.3 Experimental procedure .................................. 29
      2.3.1 Counter Efficiency for $^{234m}\text{Pa}$ ............... 30
      2.3.2 Cleaning Up ........................................ 31
   2.4 Laboratory report ........................................ 31
   2.5 Lecture No. 2 ........................................... 32

3 α-Particle spectroscopy - The thorium decay series
   3.1 References .................................................. 35
   3.2 Introduction and Prelab assignment .................... 35
   3.3 Experimental Procedures .................................. 36
      3.3.1 The Surface-barrier detector .................... 36
      3.3.2 $^{212}\text{Bi}$ Decay ................................. 36
   3.4 Lecture No. 3 ........................................... 39

8.3.2 Isotope dilution ................................. 81
8.3.3 Analysis of unknown .......................... 82
8.4 Lecture No.8 ................................. 83

9 Instrumentation for nuclear spectroscopy ................................. 86
  9.1 Introduction .................................... 86
  9.2 Experimental Procedures .......................... 86
  9.2.1 The Oscilloscope, Amplifiers and Discriminators .................. 86
  9.2.2 The Pulse Height Analyzer (PHA) or The Computer as A PHA .... 87
  9.2.3 Timing Resolution ............................. 88
  9.2.4 The resolving time and the true random coincidence rates ......... 89
  9.3 Lectures 9-10 .................................. 90

10 Construction of a Decay scheme - The Coincidence method ............... 95
  10.1 References .................................... 95
  10.2 Introduction and Prelab assignment ......................... 95
  10.3 Experimental Procedures .......................... 98
  10.3.1 Energy calibration of the pulse-height analyzer ............. 98
  10.3.2 Energies and intensities of the γ rays from an “unknown” source ................................................. 99
  10.3.3 The coincidence circuit .......................... 99
  10.3.4 The resolving time and the true random coincidence rates ..... 99
  10.3.5 Spectra of γ-rays obtained in coincidence with selected peaks 100

11 Angular correlations of gamma rays in Cascade .............................. 103
  11.1 References .................................... 103
  11.2 Introduction and Prelab work .................................. 103
  11.3 Experimental Procedures .......................... 105
  11.3.1 The apparatus ................................ 105
  11.3.2 Directional Correlation of the Annihilation Radiation ........ 105
  11.3.3 Directional correlation of the radiations from 207Bi decay ........ 105
  11.3.4 Simple theory for a dipole-dipole γ − γ cascade ............. 106
  11.4 Lecture No. 11 .................................. 109

12 Solubility of PbI₂ by use of ¹³¹I tracer .................................... 113
  12.1 References .................................... 113
  12.2 Introduction and Prelab assignment ......................... 113
  12.2.1 Experimental Procedures .......................... 114
  12.3 Lecture No. 12 .................................. 116
  12.3.1 The Idea .................................... 116
  12.3.2 Why use radioactivity? ........................... 116
  12.3.3 Solubility of PbI₂ ................................ 116
  12.3.4 Chemical equilibrium for the solubility of PbI₂ ............. 117
II Physics 322

19 Project A: Construction of a Decay Scheme

19.1 Instrumentation for nuclear spectroscopy

19.1.1 Introduction

19.1.2 Experimental Procedures

19.2 Lectures 9-10

19.3 Construction of a Decay scheme - The Coincidence method

19.3.1 References

19.3.2 Introduction and Prelab assignment

19.3.3 Experimental Procedures

19.3.4 The resolving time and the true random coincidence rates

20 Fission

20.1 References

20.2 Introduction

20.2.1 Solid State Si Detector

20.2.2 Liquid Scintillator Neutron Detector

20.3 The Experiment

21 Positrons and Positronium: Measurements of the momentum distribution of delocalized electrons in solids; and of the speed of light in air and in lucite using the positronium annihilation quanta

21.1 Abstract:

21.2 References

21.3 Background

21.4 Experiment

21.5 The speed of light (γ-rays) in air and in a dense medium

22 X-ray Fluorescence with Ge

22.1 Background

22.2 Experimental procedure

22.2.1 Setting up Ge photon Spectrometer

22.2.2 Calibration of Ge Photon Spectrometer

22.2.3 Data collection and analysis with phantoms of known Pb concentration

22.2.4 Data collection and analysis with phantom of unknown Pb concentration

23 X-Ray fluorescence with a Si-PIN detector

23.1 Pre-lab questions

23.2 The Si detector
23.3 The X-Ray generation ........................................ 210
  23.3.1 Excitation with radioactive sources ..................... 210
  23.3.2 Excitation with an X-Ray Generator with a Pyroelectric Crystal ........................................ 210
23.4 Experimental procedure for Si X-ray Fluorescence ........................................ 214
  23.4.1 1) Choose the excitation method. ..................... 214
  23.4.2 2) Create elemental calibrations. ...................... 214
  23.4.3 Analysis of unknown samples ............................ 217
  23.4.4 Self absorption for L-X rays ........................................ 217

24 Mössbauer spectroscopy- An undergraduate laboratory experiment........................................ 231
  24.1 Pre-laboratory assignment ................................ 231
  24.2 Background ..................................................... 231
  24.3 Experimental procedure ................................... 238
    24.3.1 Setting up Si (PIN) photon Spectrometer ............. 238
  24.4 Sample data analysis ....................................... 240
    24.4.1 Magnetic hyperfine splitting only-The Fe metal as standard ........................................ 240
    24.4.2 Quadrupole splitting only - (Ferrous sulfate) .......... 242
    24.4.3 The α—Fe₂O₃ analysis ........................................ 243
    24.4.4 Other samples ............................................... 246
  24.5 Problems ....................................................... 246
  24.5.1 Line intensities and angular correlation effects ........ 247
  24.6 Appendix A: Recoilless efficiency ............................ 250
  24.7 Appendix C: Some useful constants and conversions ........ 250
  24.8 Appendix D: Quadrupole moments ............................ 251
    24.8.1 Hyperfine interactions ........................................ 254
    24.8.2 The quadrupole interaction ................................. 257
  24.9 Appendix E: Nuclear magnetic moments .................... 258
  24.10 Appendix F: Chemical- or Isomer-Shift Expression ........ 262

III Instructions to the TA ........................................ 268

25 Appendix-Instructions for the TA ........................................ 269
  25.1 Measurement and absorption of beta and gamma rays .......... 274
  25.2 Preparation of Samples for Beta Counting-Efficiency of the Beta Counter ........ 277
  25.3 α—Particle detection - The thorium decay series ........... 279
  25.4 Genetic relationship of ⁴¹⁷Bi and ²⁰⁸Tl - Fast recoil chemistry ........ 282
  25.5 γ-Ray measurements with scintillation and semiconductor Ge detector ......... 283
  25.6 Measurement of ¹⁴C radiation .................................... 285
  25.7 Neutron activation - Hot atom chemistry - The Cyclotron ......... 287
  25.8 Analysis by Neutron activation and Isotope dilution ............ 289
